

Transport Digitalization

2,000

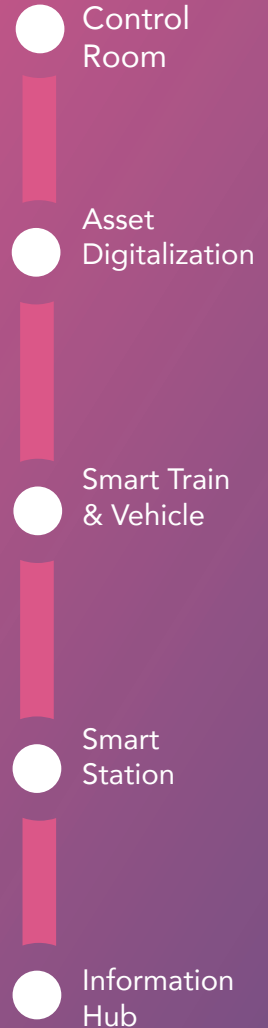

stations/day with public information systems and remote devices
diagnostics remotely managed

1,000,000

announces/day in station

20,000

devices in station

ABSOLUTE MOBILITY

Widespread use of the IoT framework can associate the actual physicality of production assets with processes and quality of service, enabling a ready for use assets' digital twin which links all the informations in an integrated, detailed and consistent view of the whole transport process and allows control and command of devices and sensors for effective asset, transport and logistical operations management.

Thanks to all the solutions included in the Asset digitalisation line, Almaviva supports the customer integrating digital with physical infrastructure and implementing innovative features for service and customer relationship management.
